Abstract	ix
List of publications	xi
List of abbreviations	xxv
1 Introduction	1
1.1 Coupled wave-guide lattice as a versatile test-bed to study light-matter interaction	3
1.1.1 Effect of refractive index disorder along the transverse width of the lattice	7
1.1.2 Effect of refractive index variation along the length of the lattice	9
1.2 Propagation dynamics of light through a coupled wave-guide lattice under the effect of complex coupling	11
1.3 Branched propagation of light through an optical lattice due to the interplay of disorder and complex-coupling	15
1.3.1 Investigating the role of complex coupling in formation and stable propagation of branches of light	17
1.3.2 Demonstrating a novel test-bed for conceptualizing a new class of nanolaser and conducting bio-mimicry investigations	17
1.4 Probing the origin of topological features in a coupled wave-guide lattice	18
1.4.1 Transition of topologically trivial lattice to a topologically non-trivial lattice	19
1.4.2 Study of topological feature in periodic lattice	20
1.4.3 Investigating unique light dynamics owing to the presence of disorder and complex-coupling in specialty topological lattice	21
1.5 Scope of this thesis and future prospects	22
2 Super-diffusive state of light: the interplay of refractive index disorder and complex coupling	25
2.1 Introduction	25
2.2 Modeling of the optical lattice by applying transverse refractive index disorder in presence of complex coupling	26
2.3 Various dynamics of beam propagation due to the interplay between complex-coupling and disorder	28
2.4 Identifying the appropriate regime of diffusive dynamics	29
2.5 Analyzing and establishing the significant role of the gain	31

2.6	Estimating the strength of applied disorder and complex coupling for the onset of super-diffusive light dynamics	33
2.7	Summary and application	34
3	Signature and kinetics of stochastic branching of light in disordered active photonic lattices	37
3.1	Introduction	37
3.2	Exotic recipe for designing of the smoothly varying weakly disordered platform	39
3.2.1	Modeling of the lattice	39
3.2.2	Characteristic features of the designed lattice	40
3.3	Investigating the propagation dynamics under the regime of branched flow . . .	41
3.4	Analyzing the important role of gain in facilitating the formation and stable propagation of branches	43
3.5	Investigating the robust propagation dynamics of branches and a proposal towards a conceptual nano-laser	46
3.6	Summary and application	46
4	Emergence of topological features in coupled wave-guide lattices	49
4.1	Introduction	49
4.2	Analytical modeling	51
4.2.1	Two-state system	51
4.2.2	Multi-state system	52
4.2.3	Crossover of photonic band-structure	54
4.3	Signature of topological-state in specialty photonic lattice	54
4.3.1	Designing of the specialty lattice	54
4.3.2	Signature of the topological interface state	58
4.4	Identifying the operational regime of the specialty topological lattice	61
4.5	Light dynamics in presence of lateral dislocation	62
4.6	Summary and application	63
5	Investigating the effect of deliberate refractive index disorder and presence of complex-coupling in specialty topological lattice	65
5.1	Introduction	65
5.2	Topological lattice design and identification of loss-less interface state	68
5.3	Investigating the effect of transverse refractive-index disorder	71
5.3.1	Coexistence of transverse Anderson localized state and topological interface state	73
5.3.2	Simultaneous propagation of non-interfering topological interface state and transverse localized state	74
5.4	Light dynamics through gain and loss assisted specialty topological lattice . . .	77
5.4.1	Effect of homogeneous gain/loss on light dynamics through the specialty topological lattice	77
5.4.2	Effect of selective gain/loss on light dynamics through the specialty topological lattice	78
5.5	Summary and application	80
6	Conclusions	81
6.1	Summary:	81
6.2	Future perspectives:	83
