Abstract	page
Acknowledgements	i
Contents	iii
List of Figures	v-vii
List of Tables	viii-ix
List of Symbols	x
List of Abbreviations	xi
	xii-xiii

Chapter 1: INTRODUCTION

1.1	Purpose of the Study	1-3
1.2	Brief Outcomes and Future Possibility of the Study	3

Chapter 2: Review of Literature

2.1	Cellular Proteome Network and its Linkage with Diseases	6-8
2.2	An Overview of Cellular Proteostasis Strategies	8-14
	2.2.1 Co-translational Quality Control Mechanism	9-10
	2.2.2 Ubiquitin Proteasome System Mediated Protein Quality Control	10-11
	2.2.3 Autophagy Mediated Protein Quality Control	11-12
	2.2.4 Protein Quality Control in Endoplasmic Reticulum	12
	2.2.5 Protein Quality Control in Mitochondria	12-13
	2.2.6 Protein Quality Control in Nucleus	13-14
2.3	Utility of Cellular Proteostasis Mechanisms in Therapeutic Interventions	15-18
	2.3.1 Chaperone Machinery	15-16
	2.3.2 Ubiquitin Proteasome System	16
	2.3.3 Endoplasmic Reticulum Stress Response Pathway	16-17
	2.3.4 Autophagy	17-18
2.4	Proteostasis Mechanisms as Targets of Known Natural and Pharmaceutical Molecules	18-25
	2.4.1 Natural Compounds	19-22
	2.4.2 Pharmacological Compounds	22-24
2.5	Role of Proteasomes in Nonsteroidal Anti-Inflammatory Drugs Mediated Apoptosis	24-25

Chapter 3: Proteasomal Dysfunction Induced by Diclofenac Engenders Apoptosis Through Mitochondrial Pathway

3.1	Results	27-43
	3.1.1 Diclofenac Treatment Causes Stabilization of Ubiquitylated Misfolded or Abnormal Proteins	27-29
	3.1.2 Diclofenac Disturbs Proteasome Function and Sensitizes Cells Towards Apoptosis	29-31
	3.1.3 Diminished Proteasome Activity after Diclofenac Treatment Blocks the Elimination of Aggregation Prone Ubiquitylated Proteins	31-34
	3.1.4 Diclofenac Treatment Stabilizes the Degradation of Model Substrates of Proteasome and Accumulates Ubiquitin Positive Insoluble Complexes	35-27
	3.1.5 Diclofenac Treatment Disturbs Levels of Pro-Apoptotic Proteasome Target Proteins and Induces Apoptotic Events in Cells	37-41
	3.1.6 Mitochondrial Dysfunction and Cytochrome c Release after Treatment of Diclofenac in Cells	41-43
3.2	Discussion	43-45
3.3	Concluding Remarks	45

Chapter 4: Indomethacin Elicits Proteasomal Dysfunctions and Develop Apoptosis Through Mitochondrial Abnormalities

4.1	Results	
	4.1.1 Indomethacin Interacts with Proteasome Subunits and Elevates Apoptosis	47-49

	Characteristic in Cells	
4.1.2	Proteasomal Dysfunctions Induced by Indomethacin Elevates Accumulation of Aggregate Prone Proteins in Cells	49-54
4.1.3	Indomethacin Increases Ubiquitylated Proteins Aggregation and Consequently Generates Aggresomes in Cells	54-59
4.1.4	Intracellular Accumulation of Critical Proteasome Substrates After Indomethacin Treatment Induces Key apoptotic Events in Cells	59-63
4.1.5	Indomethacin Induced Proteasomal Dysfunction Generates Mitochondrial Abnormalities	63-65
4.2	Discussion	65-67
4.3	Concluding Remarks	67
Chapter 5: Conclusion		
5.1	Summary	69
5.2	Concluding Remarks	69
5.3	Closing Comments	70
Annexure A: Materials and Methods		
A.1	Materials	71-72
	A.1.1 Cell Lines	72
A.2	Methods	72-75
	A2.1 Cell Culture, Treatment and Transfection	72
	A2.2 Proteasome Assay (In Cells and Purified Proteasome)	72
	A2.3 Immunoblotting Experiment	73
	A2.4 Immunofluorescence Technique	73
	A2.5 Docking Studies	73
	A2.6 Flow Cytometry Analysis	73
	A2.7 TUNEL Assay	74
	A2.8 MTT Assay	74
	A2.9 Reporter Gene Assay	74
	A2.10 JC-1 Staining	74
	A2.11 STD-NMR Experiment	74
	A2.12 Senescence Associated Beta Galactosidase Experiment	74
	A2.13 Neurite Outgrowth Experiment	75
	A2.14 Cell Fractionation	75
	A2.15 Quantification of Immunoblots and Statistical Analysis	75
	References	77-96
